

CASE STUDY · AI QA AUTOMATION

QA Pilot

Give it a URL. It learns the app, writes the tests, runs them, and reports the bugs.

localhost:8000 · Run overview

THE CHALLENGE

Small teams ship web apps nobody really tested.

Manual QA is slow and expensive, test suites take weeks to write, and the bug reports that do arrive are vague.

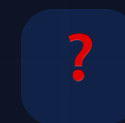

Slow and costly

Clicking through every role and every form before each release takes days — so it gets skipped.

Gaps nobody sees

Permission holes, wrong totals and broken state rules hide in screens that only some roles reach.

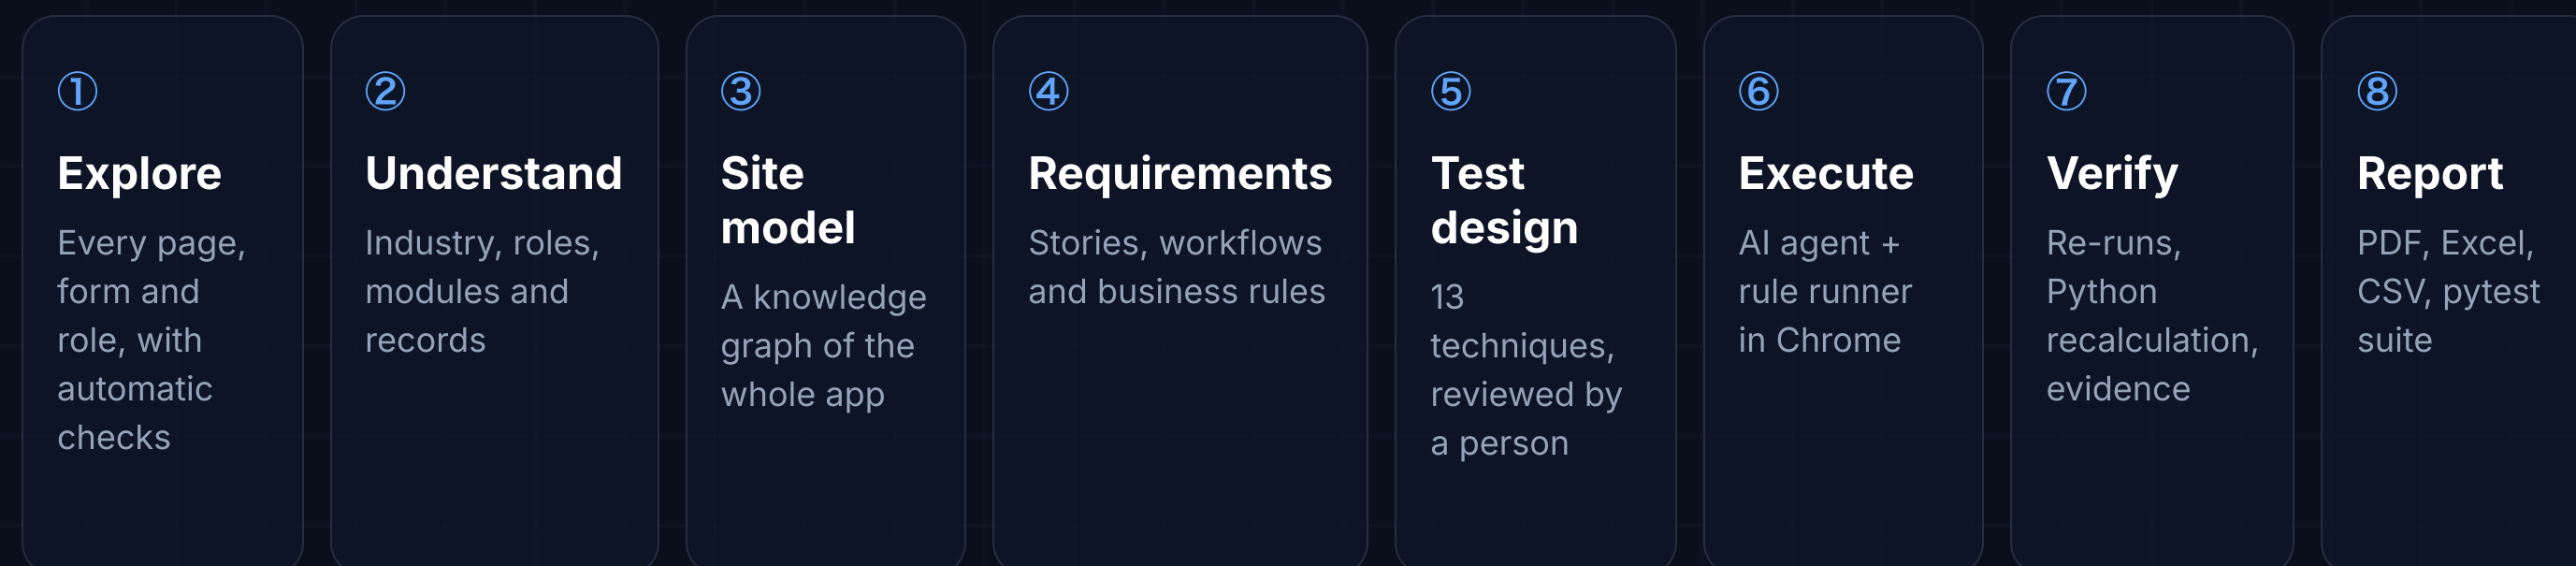

"It doesn't work"

Bug reports without steps, data or evidence cost developers hours to reproduce.

THE SOLUTION

An AI QA engineer that runs on your own computer.

QA Pilot explores the app like a new tester, writes down what it should do, tests it in a real browser and proves every bug it reports.

100% local · no database · your data stays in a folder · the only external call is the Claude API.

WORKS ON ANY INDUSTRY

Three very different apps. No hints given.

CarePoint Clinic

Healthcare · clinic
management

Insurance coverage on invoices, no double-booked doctors,
inactive doctors not bookable, cancelled visits can't be
completed

13/15

planted bugs found

DriveNow Rentals

Rental · car rental back
office

Minimum one-day rental, 10 % discount from 7 days, no
overlapping bookings, cars in maintenance not bookable

15/15

planted bugs found

StockRoom POS

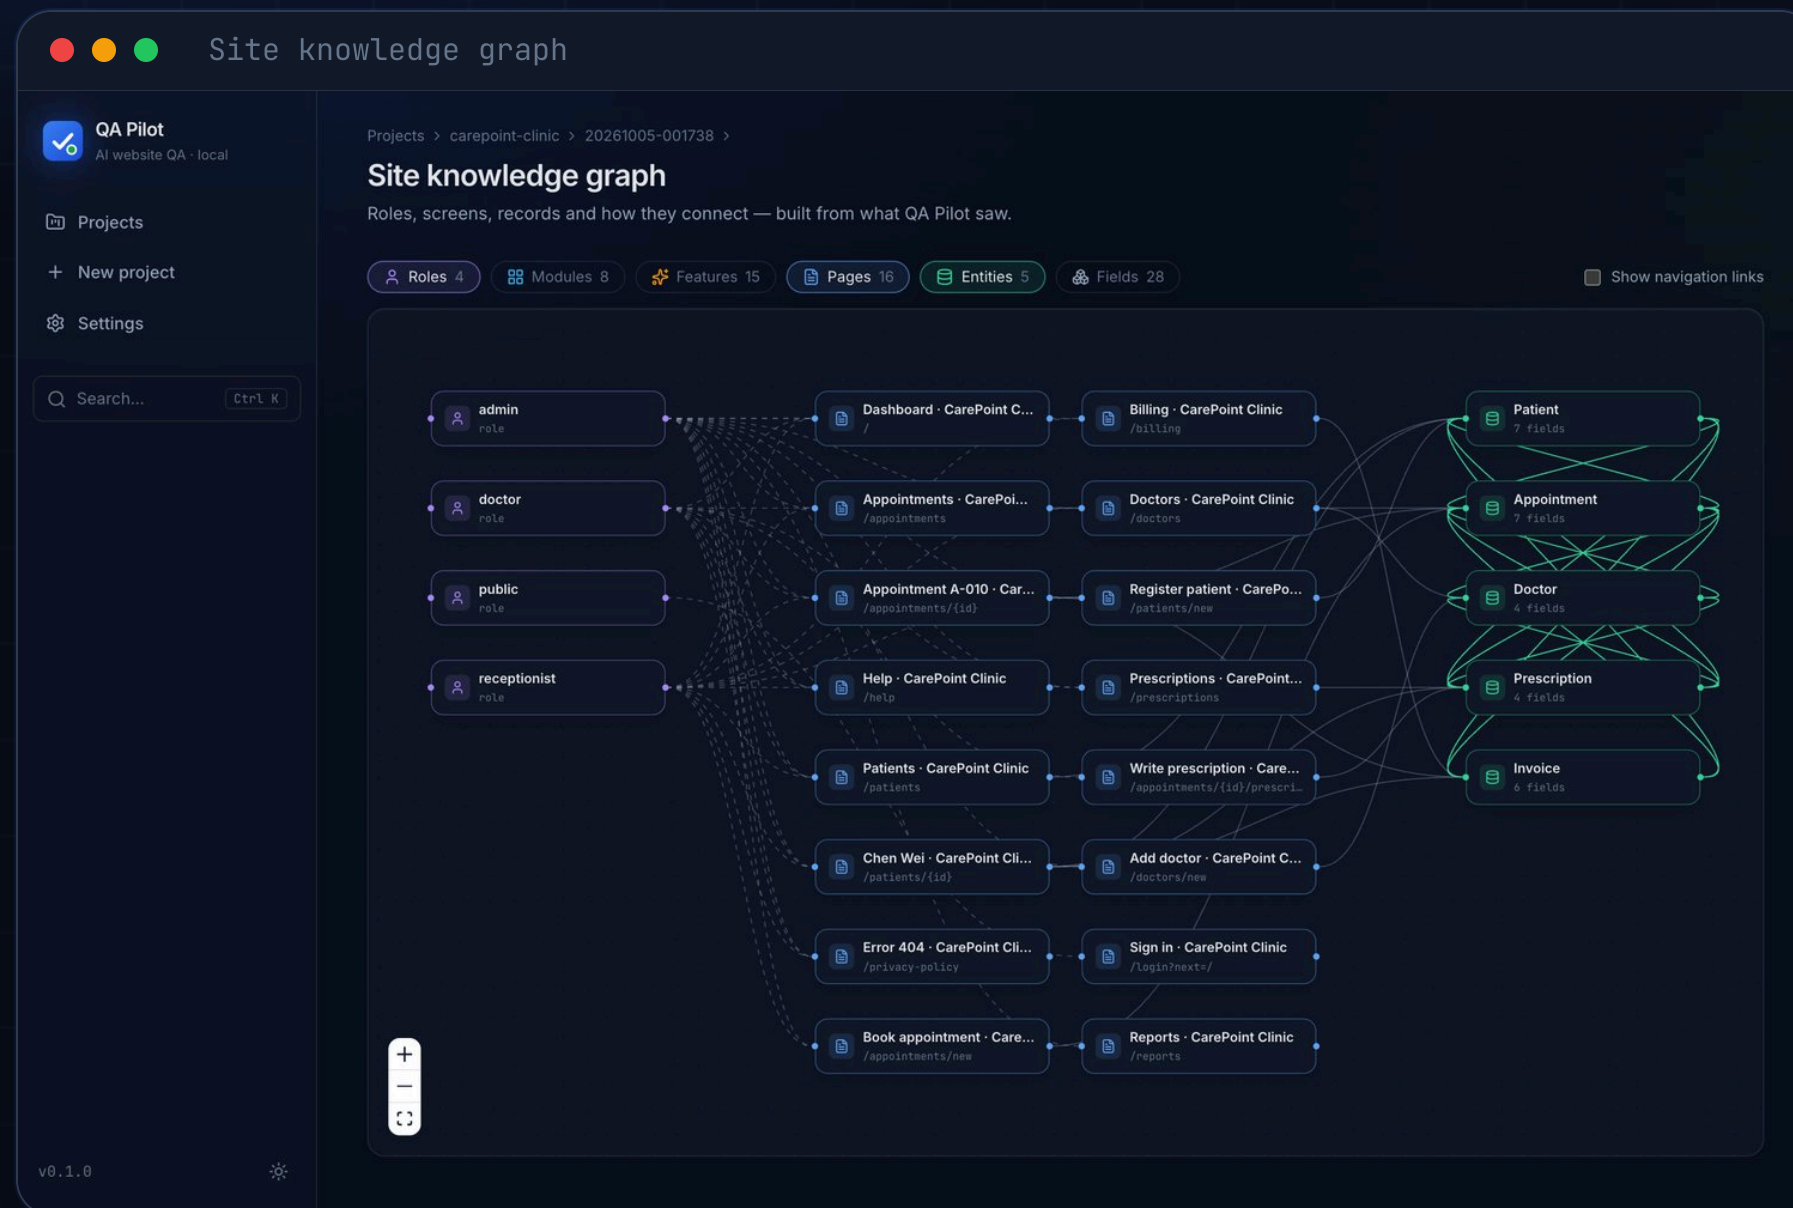

E-commerce · retail point
of sale

Total = subtotal + VAT, stock moves on sale and refund, one
refund per sale, profit report admin-only

13/15

planted bugs found

It builds a map of the app before it tests anything.

- ✓ Roles, screens, records and flows in one graph
- ✓ Which role reaches which screen — the base of the permission matrix
- ✓ Domain packs for 12 industries, plus Claude for the details
- ✓ Requirements and business rules a person confirms

Real test cases, with data and expected values.

- Smoke
- CRUD · E2E
- Validation
- Boundary values
- Equivalence classes
- State transitions
- Permissions
- Data integrity
- Business rules
- Responsive · Accessibility

Business rules come with computed results — *fee 120.00 at 50 % coverage → patient pays 60.00* — and are re-checked in Python after the run.

Built to be trusted.

Agent loop

One action per Claude turn, an indexed element list plus screenshot, working memory and loop detection.

Self-healing replay

Every agent run becomes a replay script with multi-strategy locators; broken locators hand back to the agent.

Re-run verification

Failures run again: 3/3 confirmed, 1/3 flaky → needs review. Rule numbers re-computed in Python.

Permission matrix

Expected access from each role's menus vs what direct URLs really allow — holes in red.

Privacy & safety

Safe Mode guard on every click, encrypted credentials, PII blur, authorization record.

Local, file-based

No database: atomic JSON writes, file locks, schema versions — zip a project and move it.

41 of 45 planted bugs found.

91%

detection rate across three demo apps (41/45)

9

false positives in 67 bug reports

\$16.84

total Claude cost for all three apps, end to end

CarePoint Clinic

13/15 planted · 7 other genuine issues · 2 false positives

71 tests · \$5.88

DriveNow Rentals

15/15 planted · 2 other genuine issues · 1 false positive

60 tests · \$4.87

StockRoom POS

13/15 planted · 4 other genuine issues · 6 false positives

63 tests · \$6.09

Planted bugs are listed in answer keys the engine never reads; each match was checked and is listed in docs/benchmarks.json.

Proven tools, put together carefully.
